Critical Safety Essentials

At Interflow, safety is one of the pillars that underpins everything we do. We are committed to continual improvement in the way we manage our Operations, Environmental and Safety obligations.

Interflow understands the importance of its Health, Safety and Environment (HSE) obligations and the need to constantly challenge our performance and the way we approach HSE.

The Interflow Critical Safety Essentials (CSEs) have been developed to define the minimum mandatory control measures for the identified critical and fatal risks Interflow is exposed to across our operations.

The CSEs form a key part of the overall HSE Management System Framework.

The Critical Safety Essentials (CSEs) outline and provide:

- What are our critical and fatal risks
- Mandatory requirements to assist key stakeholders with planning and mitigating risk
- Guidance on how to know and verify controls are functioning as they should

The Critical Safety Essentials (CSEs) apply to all Interflow workers and contractors across our operations.

The 11 CSEs are focussed on the below risks;

Confined Space Entry

Crane and Lifting Operations

Traffic and Road Safety

Excavation and Trenching

Fall Prevention

High Pressure Water Jetting

Working on or near Water

Mobile Plant

Electrical Safety and Metallic Water Pipes

Overhead and Underground Services

Lock Out Tag Out (LOTO) and Flow Management

A key outcome of the CSE development, is to form the content of Interflow's Line 1 HSE Assurance Criteria – further driving Interflow's obsession with controlling our critical and fatal risks.
